## Exercise 14.3

### Question 1:

Name any two figures that have both line symmetry and rotational symmetry.

### Answer 1:

Circle and Square.

### Question 2:

Draw, wherever possible, a rough sketch of:

- a triangle with both line and rotational symmetries of order more than 1.
- a triangle with only line symmetry and no rotational symmetry of order more than 1.
- a quadrilateral with a rotational symmetry of order more than 1 but not a line symmetry.
- a quadrilateral with line symmetry but not a rotational symmetry of order more than 1.

### Answer 2:

- An equilateral triangle has both line and rotational symmetries of order more than 1.

Line symmetry:

Rotational symmetry:

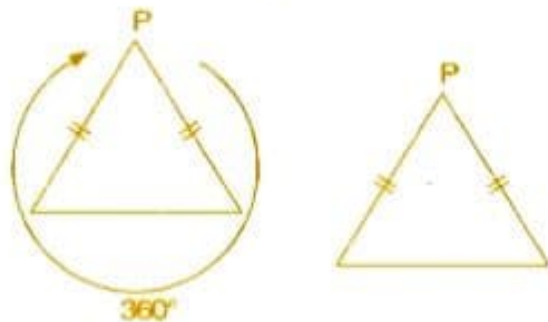

- (ii) **An isosceles triangle has only one line of symmetry and no rotational symmetry of order more than 1.**

**Line symmetry:**

**Rotational symmetry:**

- (iii) **It is not possible because order of rotational symmetry is more than 1 of a figure, most ascertain the line of symmetry.**
- (iv) **A trapezium which has equal non-parallel sides, a quadrilateral with line symmetry but not a rotational symmetry of order more than 1.**

**Line symmetry:**

**Rotational symmetry:**

### Question 3:

In a figure has two or more lines of symmetry, should it have rotational symmetry of order more than 1?

### Answer 3:

Yes, because every line through the centre forms a line of symmetry and it has rotational symmetry around the centre for every angle.

### Question 4:

Fill in the blanks:

Shape	Centre of Rotation	Order of Rotation	Angle of Rotation
Square			
Rectangle			
Rhombus			
Equilateral triangle			
Regular hexagon			
Circle			
Semi-circle			

### Answer 4:

Shape	Centre of Rotation	Order of Rotation	Angle of Rotation
Square	Intersecting point of diagonals.	4	90°
Rectangle	Intersecting point of diagonals.	2	180°
Rhombus	Intersecting point of diagonals.	2	180°
Equilateral triangle	Intersecting point of medians.	3	120°
Regular hexagon	Intersecting point of diagonals.	6	60°
Circle	Centre	infinite	At every point
Semi-circle	Mid-point of diameter	1	360°

**Question 5:**

Name the quadrilateral which has both line and rotational symmetry of order more than 1.

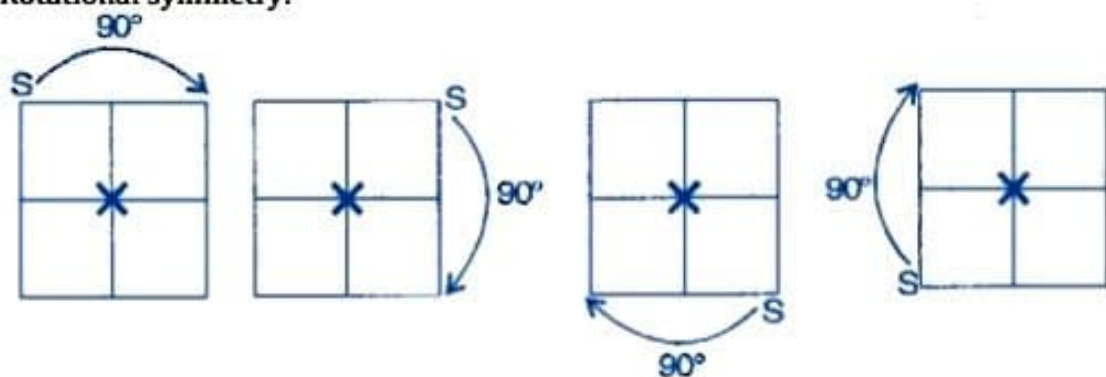

**Answer 5:**

Square has both line and rotational symmetry of order more than 1.

Line symmetry:

Rotational symmetry:

**Question 6:**

After rotating by  $60^\circ$  about a centre, a figure looks exactly the same as its original position. At what other angles will this happen for the figure?

**Answer 6:**

Other angles will be  $120^\circ, 180^\circ, 240^\circ, 300^\circ, 360^\circ$ .

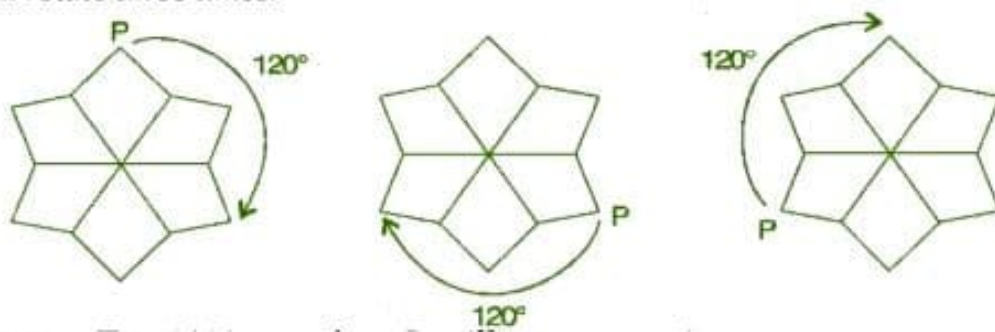

For  $60^\circ$  rotation:

It will rotate six times.

For  $120^\circ$  rotation:  
It will rotate three times.

For  $180^\circ$  rotation:  
It will rotate two times.

For  $360^\circ$  rotation:  
It will rotate one time.

**Question 7:**

Can we have a rotational symmetry of order more than 1 whose angle of rotation is:

(i)  $45^\circ$

(ii)  $17^\circ$  ?

**Answer 7:**

- (i) If the angle of rotation is  $45^\circ$ , then symmetry of order is possible and would be 8 rotations.
- (ii) If the angle of rotational is  $17^\circ$ , then symmetry of order is not possible because  $360^\circ$  is not complete divided by  $17^\circ$ .
