

**Quadrilaterals Ex-8.2 (solved exercise) Class-9 by-Ashish Jha**

**Question 1.**

**ABCD is a quadrilateral in which P, Q, R and S are mid-points of the sides AB, BC, CD and DA (see figure). AC is a diagonal. Show that**

**(i)  $SR \parallel AC$  and  $SR = \frac{1}{2} AC$**

**(ii)  $PQ = SR$**

**(iii) PQRS is a parallelogram.**

Solution:

(i) In  $\triangle ACD$ , We have

$\therefore$  S is the mid-point of AD and R is the mid-point of CD.

$SR = \frac{1}{2} AC$  and  $SR \parallel AC$  ... (1)

[By mid-point theorem]

(ii) In  $\triangle ABC$ , P is the mid-point of AB and Q is the mid-point of BC.

$PQ = \frac{1}{2} AC$  and  $PQ \parallel AC$  ... (2)

[By mid-point theorem]

From (1) and (2), we get

$PQ = \frac{1}{2} AC = SR$  and  $PQ \parallel AC \parallel SR$

$\Rightarrow PQ = SR$  and  $PQ \parallel SR$

(iii) In a quadrilateral PQRS,

$PQ = SR$  and  $PQ \parallel SR$  [Proved]

$\therefore$  PQRS is a parallelogram.

**Question 2.**

**ABCD is a rhombus and P, Q, R and S are the mid-points of the sides AB, BC, CD and DA, respectively. Show that the quadrilateral PQRS is a rectangle.**

**Solution:**

We have a rhombus ABCD and P, Q, R and S are the mid-points of the sides AB, BC, CD and DA respectively. Join AC.

NCERT Solutions for Class 9 Maths Chapter 8 Quadrilaterals Ex 8.2 A2

In  $\triangle ABC$ , P and Q are the mid-points of AB and BC respectively.

$\therefore PQ = \frac{1}{2}AC$  and  $PQ \parallel AC$  ... (1)

[By mid-point theorem]

In  $\triangle ADC$ , R and S are the mid-points of CD and DA respectively.

$\therefore SR = \frac{1}{2}AC$  and  $SR \parallel AC$  ... (2)

[By mid-point theorem]

From (1) and (2), we get

$PQ = \frac{1}{2}AC = SR$  and  $PQ \parallel AC \parallel SR$

$\Rightarrow PQ = SR$  and  $PQ \parallel SR$

$\therefore PQRS$  is a parallelogram. .... (3)

Now, in  $\triangle ERC$  and  $\triangle EQC$ ,

$\angle 1 = \angle 2$

[ $\because$  The diagonals of a rhombus bisect the opposite angles]

$CR = CQ$  [ $\because CD = BC$ ]

$CE = CE$  [Common]

$\therefore \triangle ERC \cong \triangle EQC$  [By SAS congruency]

$\Rightarrow \angle 3 = \angle 4$  ... (4) [By C.P.C.T.]

But  $\angle 3 + \angle 4 = 180^\circ$  .... (5) [Linear pair]

From (4) and (5), we get

$\Rightarrow \angle 3 = \angle 4 = 90^\circ$

Now,  $\angle RQP = 180^\circ - \angle 4$  [Y Co-interior angles for  $PQ \parallel AC$  and  $EQ$  is transversal]

But  $\angle 5 = \angle 3$

[ $\because$  Vertically opposite angles are equal]

$\therefore \angle 5 = 90^\circ$

So,  $\angle RQP = 180^\circ - \angle 5 = 90^\circ$

$\therefore$  One angle of parallelogram  $PQRS$  is  $90^\circ$ .

Thus,  $PQRS$  is a rectangle.

### Question 3.

**ABCD is a rectangle and P, Q, R and S are mid-points of the sides AB, BC, CD and DA, respectively. Show that the quadrilateral PQRS is a rhombus.**

**Solution:**

We have,

Now, in  $\triangle ABC$ , we have

$PQ = \frac{1}{2}AC$  and  $PQ \parallel AC$  ... (1)

[By mid-point theorem]

Similarly, in  $\triangle ADC$ , we have

$SR = \frac{1}{2}AC$  and  $SR \parallel AC$  ... (2)

From (1) and (2), we get

$PQ = SR$  and  $PQ \parallel SR$

$\therefore PQRS$  is a parallelogram.

Now, in  $\triangle PAS$  and  $\triangle PBQ$ , we have

$\angle A = \angle B$  [Each  $90^\circ$ ]

$AP = BP$  [ $\because P$  is the mid-point of  $AB$ ]

$AS = BQ$  [ $\because \frac{1}{2}AD = \frac{1}{2}BC$ ]

$\therefore \triangle PAS \cong \triangle PBQ$  [By SAS congruency]

$\Rightarrow PS = PQ$  [By C.P.C.T.]

Also,  $PS = QR$  and  $PQ = SR$  [ $\because$  opposite sides of a parallelogram are equal]

So,  $PQ = QR = RS = SP$  i.e.,  $PQRS$  is a parallelogram having all of its sides equal.

Hence,  $PQRS$  is a rhombus.

#### Question 4.

**$ABCD$  is a trapezium in which  $AB \parallel DC$ ,  $BD$  is a diagonal and  $E$  is the mid-point of  $AD$ . A line is drawn through  $E$  parallel to  $AB$  intersecting  $BC$  at  $F$  (see figure). Show that  $F$  is the mid-point of  $BC$**

#### Solution:

We have,

In  $\triangle DAB$ , we know that  $E$  is the mid-point of

$AD$  and  $EG \parallel AB$  [ $\because EF \parallel AB$ ]

Using the converse of mid-point theorem, we get,  $G$  is the mid-point of  $BD$ .

Again in  $\triangle BDC$ , we have  $G$  is the midpoint of  $BD$  and  $GF \parallel DC$ .

[ $\because AB \parallel DC$  and  $EF \parallel AB$  and  $GF$  is a part of  $EF$ ]

Using the converse of the mid-point theorem, we get,  $F$  is the mid-point of  $BC$ .

#### Question 5.

**In a parallelogram  $ABCD$ ,  $E$  and  $F$  are the mid-points of sides  $AB$  and  $CD$  respectively (see figure). Show that the line segments  $AF$  and  $EC$  trisect the diagonal  $BD$ .**

Solution:

Since, the opposite sides of a parallelogram are parallel and equal.

$\therefore AB \parallel DC$

$\Rightarrow AE \parallel FC \dots(1)$

and  $AB = DC$

$\Rightarrow 12AB = 12DC$

$\Rightarrow AE = FC \dots(2)$

From (1) and (2), we have

$AE \parallel FC$  and  $AE = FC$

$\therefore \triangle AEF$  is a parallelogram.

Now, in  $\triangle DQC$ , we have F is the mid-point of DC and  $FP \parallel CQ$

[ $\because AF \parallel CE$ ]

$\Rightarrow DP = PQ \dots(3)$

[By converse of mid-point theorem] Similarly, in  $\triangle BAP$ , E is the mid-point of AB and  $EQ \parallel AP$

[ $\because AF \parallel CE$ ]

$\Rightarrow BQ = PQ \dots(4)$

[By converse of mid-point theorem]

$\therefore$  From (3) and (4), we have

$DP = PQ = BQ$

So, the line segments AF and EC trisect the diagonal BD.
